# Binormal Measures 

EMMANUEL P. SMYRNELIS, PANAYOTIS SMYRNELIS<br>Department of Mathematics, University of Athens, Panepistimiopolis 15784, Athens, GREECE

#### Abstract

Our starting point is the measure $\varepsilon_{X}-\alpha_{X} \rho_{X}^{\omega_{1}}+\beta_{X} \rho_{X}^{\omega_{2}}$, where $\rho_{X}^{\omega_{i}}$ is the harmonic measure relative to $x \in \omega_{1} \subset \bar{\omega}_{1} \subset \omega_{2}$ and $\omega_{i}$ are concentric balls of $\mathbb{R}^{n} ; \alpha_{X}, \beta_{X}$ are functions depending on $x$ and the radii of $\omega_{i}$ ( $i=1,2$ ). Generalizing the above measure, we introduce and study the binormal measures as well as their relation to biharmonic functions.

Key-Words: - Normal measures, binormal measures, biharmonic functions, mean value properties, applications to PDE (MSC 2020: 31B30, 31D05, 35B05)

Received: September 17, 2022. Revised: April 7, 2023. Accepted: May 1, 2023. Published: May 17, 2023.

## 1 Introduction

The characteristic mean value property of harmonic (respectively parabolic) functions involves the measures $\lambda=\varepsilon_{X}-\rho_{X}^{\omega}$, where $\varepsilon_{X}$ is the Dirac measure at $x \in \omega$ and $\rho_{X}^{\omega}$ is the harmonic (respectively parabolic) measure relative to $\omega$ and $x \epsilon \omega$, supported by the sphere $\partial \omega$ (respectively by the level surface $\partial \omega$ of the heat kernel). The adjoint potential of these measures is equal to zero on $C \bar{\omega}$ (the complement of $\bar{\omega}$ ), or equivalently, their swept measures satisfy $\lambda^{\text {C此 }}=0$.

In 1944, G. Choquet and J. Deny generalized the measure $\varepsilon_{X}-\rho_{X}^{\omega}$, and introduced the normal distribution. Moreover, they proved some characteristic properties of solutions of the equations $\Delta u=0$, and $\Delta^{p} u=0$ in $\mathbb{R}^{n}$. Next, in 1967, de La Pradelle following an idea of [8], extended the notion of normal measure to the setting of Brelot's theory, [3]. Finally, in 1971, E. Smyrnelis, using the extended notion of normal measure, proved several characteristic properties of normal measures and harmonic functions in Brelot spaces, applicable to solutions of $L u=0$, where $L$ is a second-order linear elliptic operator in $\mathbb{R}^{n}$.

On the other hand, biharmonic functions (that is, solutions of $\Delta^{2} u=0$ ) satisfy a mean value property which involves the measures $\varepsilon_{X}-\alpha_{X} \rho_{X}^{\omega_{1}}+\beta_{X} \rho_{X}^{\omega_{2}}$, where $\alpha_{X}, \beta_{X}$ are functions of $x \epsilon \omega_{1} \subset \bar{\omega}_{1} \subset \omega_{2}$ and of the radii $R_{1}, R_{2}$ of the concentric spheres $\partial \omega_{1}$, $\partial \omega_{2}$ (cf., [17]). The scope of this article is to generalize this property and study some related
issues, for the solutions of the equation $\left(L_{2} L_{1}\right) h=$ 0 , where $L_{i}(i=1,2)$ is a second-order linear elliptic differential operator. The idea is to work in a biharmonic elliptic space, and use special general measures, applicable to the above equation, in particular; note that to this biharmonic elliptic space, we associate a 1 -harmonic and a 2 -harmonic space that in the applications correspond respectively to the solutions of the equations $L_{1} h=0$, and $L_{2} u=$ 0 .

To this end, we first introduce in Section 2, the binormal pair of measures $\Theta=(\lambda, \mu)$ supported by the compact set $K$, as the pair such that the swept measures on $C K$ of $\Lambda:=(\lambda, 0)$ and $M:=(0, \mu)$ vanish. Since $\Theta=\Lambda+M$, it follows that $\Theta^{C K}=$ $\Lambda^{C K}+M^{C K}$ or $(\lambda, \mu)^{C K}=(\lambda, 0)^{C K}+(0, \mu)^{C K} \quad$ (cf., [15]).

The pair $(\lambda, 0)$ is called a pure biharmonic pair if $(\lambda, 0)^{C K}=(0,0)$ or equivalently if the pure adjoint potential pair vanishes on $C K$.

The pair $(0, \mu)$ is called 2-normal if $(0, \mu)^{C K}=$ $(0,0)$ or equivalently if the 2 -adjoint potential vanishes on CK (see, [14]).

Several examples of the aforementioned pairs of measures are given in Section 3.

In Section 4, we prove the characteristic mean value properties of biharmonic pairs in relation to biharmonic pairs of measures.

Section 5 is devoted to the study of the properties of binormal pairs of measures. Furthermore, we show that the linear combinations of the pairs $\left(\varepsilon_{X}-\right.$ $\mu_{X}{ }^{C K}, v_{X}{ }^{C K}$ ) are dense for the vague topology, in the space of the pure binormal pairs of measures, where $\left(\mu_{X}{ }^{C K}, v_{X}{ }^{C K}\right)=\left(\varepsilon_{X}, 0\right)^{C K}$. Analogous results hold for the measures $\varepsilon_{X}-\mu_{X}{ }^{C K}$ (respectively $\varepsilon_{X}-$ $\lambda_{X}{ }^{C K}$ ) in the space of 1-normal (respectively 2 normal) measures, where $\mu_{X}{ }^{C K}$ is the swept nonnegative measure of $\varepsilon_{X}$ in the 1-harmonic space (respectively $\lambda_{X}{ }^{C K}$ is the swept nonnegative measure of $\varepsilon_{X}$ in the 2 -harmonic space). Finally, we examine the relation between binormal and normal measures.

Note. In this work, we use the term 'measure' for `signed measure'.

## 2 Reminders, Definitions, and Preliminary Results

Let us first point out there are equivalent views of potential theory. We refer for instance to [1], [11].

In this paper, our setting is a general biharmonic space, as the space of solutions of the system $L_{1} u_{1}=-u_{2}, L_{2} u_{2}=0$, where $L_{i}(i=1,2)$ is a second-order linear elliptic or parabolic differential operator (cf., [15]). From this space, one can construct using Green's pairs, the associated adjoint space corresponding to the system $L_{2}^{*} h_{2}=-h_{1}$, $L_{1}^{*} h_{1}=0$, which is in duality with the initial space (cf., [20]). In this context, the potential theory of the harmonic case can be extended, and appropriate tools are provided to study boundary value problems. We also point out in [21], [22], two different approaches to the study of the biharmonic boundary value problem.

In what follows, we briefly present the main facts about biharmonic spaces. These spaces have been inspired by the classical biharmonic equation $\Delta^{2} u=$ $\Delta(\Delta u)=0$, and we point out that the polyharmonic case can be studied with the same approach. For more details, we refer to [12].

We consider a locally compact, connected space $\Omega$ with a countable basis. We denote by $\mathcal{U}$ (respectively $\mathcal{U}_{c}$ ) the set of all nonempty open sets (respectively the set of all nonempty relatively compact open sets) in $\Omega$.

Let $\mathcal{H}$ be a map that associates to each $U \in \mathcal{U}$ a linear subspace of $C(U) \times C(U)$ which is composed of compatible pairs $\left(u_{1}, u_{2}\right)$ in the sense that if $u_{1}=$ 0 on an open set, then $u_{2}$ also vanishes there. The pairs of $\mathcal{H}(U)$ are called biharmonic on $U$.

On the other hand, a set $\omega \in \mathcal{U}_{c}$ with $\partial \omega \neq \varnothing$ is called $\mathcal{H}$-regular if the following conditions hold:

- The Riquier boundary value problem has only one solution $\left(H_{1}^{\omega, f}, H_{2}^{\omega, f}\right)$ associated to the pair $f=\left(f_{1}, f_{2}\right) \in C(\partial \omega) \times C(\partial \omega)$.
- The inequalities $f_{j} \geq 0(j=1,2)$ imply that $H_{1}^{\omega, f} \geq 0$, while the inequality $f_{2} \geq 0$ implies that $H_{2}^{\omega, f} \geq 0$. Hence, for every $x \in$ $\omega$, there exists a unique system $\left(\lambda_{x}^{\omega}, \mu_{x}^{\omega}, v_{x}^{\omega}\right)$ of Radon nonnegative measures on $\partial \omega$, such that $H_{1}^{\omega, f}(x)=$ $\int f_{1} d \mu_{x}^{\omega}+\int f_{2} d v_{x}^{\omega}, \quad$ while $H_{2}^{\omega, f}(x)=$ $\int f_{2} d \lambda_{x}^{\omega}$.

Next, we recall that a pair of functions $\left(v_{1}, v_{2}\right)$ defined on $U \in \mathcal{U}$, is called hyperharmonic if

- $v_{j}: U \rightarrow(-\infty,+\infty]$,
- $\quad v_{j}$ is lower semi-continuous,
- and the inequalities $v_{1}(x) \geq \int v_{1} d \mu_{x}^{\omega}+$ $\int v_{2} d v_{x}^{\omega}$, as well as $v_{2}(x) \geq \int v_{2} d \lambda_{x}^{\omega}$, hold for every regular set $\omega \subset \bar{\omega} \subset U$, and every $x \in \omega$.

Let us also mention that if the function $v_{1}$ is finite on a dense subset of $U$, then the hyperharmonic pair $\left(v_{1}, v_{2}\right)$ is called superharmonic on $U$. Finally, a nonnegative superharmonic pair $p=\left(p_{1}, p_{2}\right)$ will be called potential pair (on $U$ ), if $\left(h_{1}, h_{2}\right)=(0,0)$ is the only biharmonic pair satisfying $0 \leq h_{j} \leq$ $p_{j}(j=1,2)$.

The space $(\Omega, \mathcal{H})$ with the axioms I, II, III, and IV introduced in [15], is called biharmonic. A biharmonic space is called elliptic if, for every $x \in$ $\Omega$ and every regular set $\omega \ni x$, we have $\operatorname{supp}\left(\lambda_{x}^{\omega}\right)=\operatorname{supp}\left(\mu_{x}^{\omega}\right)=\operatorname{supp}\left(v_{x}^{\omega}\right)=\partial \omega$; it will be called strong if there exists a strictly positive potential pair on $\Omega$. In a biharmonic space, we associate the underlying harmonic spaces $\left(\Omega, \mathcal{H}_{1}\right)$ and $\left(\Omega, \mathcal{H}_{2}\right)$, which correspond respectively to the solutions of the equations $L_{1} u_{1}=0$, and $L_{2} u_{2}=0$ in the classical case. We use respectively the
prefixes 1 or 2, to refer to the harmonic spaces defined previously.

We shall say that the hyperharmonic (respectively superharmonic/potential) pair ( $v_{1}, v_{2}$ ) is pure, if given a nonnegative 2-hyperharmonic function $v_{2}$ on $U, v_{1}$ is the smallest nonnegative function such that $\left(v_{1}, v_{2}\right)$ is a nonnegative hyperharmonic (respectively superharmonic/potential) pair on $U$. The $j$-harmonic (respectively biharmonic) support of a $j$-hyperharmonic function (respectively hyperharmonic pair) is defined as the smallest closed set such that the function (respectively the pair) is $j$-harmonic (respectively biharmonic) in its complement ( $j=1,2$ ). We call Green's pair, a pure potential pair with punctual biharmonic support. We also recall that if $\varphi$ is a numerical function on an open set $U$, the function $\hat{\varphi}$ is defined as follows:

$$
\hat{\varphi}(x)=\lim _{\substack{y \rightarrow x \\ y \in U}} \inf \varphi(y) .
$$

In [20], we define and study the adjoint biharmonic spaces corresponding to the adjoint equation $\left(L_{2} L_{1}\right)^{*} h=0$, that is, to the system:

$$
L_{2}^{*} h_{2}=-h_{1}, L_{1}^{*} h_{1}=0 .
$$

The asterisk symbol is used in the sequel to refer to adjoint spaces.

Our setting will be a strong biharmonic elliptic connected space. We assume the proportionality of $i$-Green's potentials and $i$-adjoint Green's potentials, and also the existence of a topological basis of completely determining domains for the associated $i$-harmonic spaces $(i=1,2)$. For the notions and notations not explained in this work, we refer to [15], [9].

Definition 1. Let $\lambda, \mu$ be Radon measures supported by a compact set $K \subset \Omega$, and let $\lambda=\lambda_{1}-\lambda_{2}, \mu=$ $\mu_{1}-\mu_{2}$, with $\lambda_{j} \geq 0, \mu_{j} \geq 0,(j=1,2)$.

- The pair $(\lambda, \mu)$ is called binormal for $K$ if $(\lambda, 0)^{C K}=(0,0)$ and $(0, \mu)^{C K}=(0,0)$.
- The pair $(\lambda, 0)$ is called pure binormal for $K$ if $(\lambda, 0)^{C K}=(0,0)$.
- The pair $(0, \mu)$ is called 2-normal for $K$ if $(0, \mu)^{C K}=(0,0)$.

Let us consider the open subset $\omega \subset \Omega$, the points $x, y \in \Omega$, the Green's pair $\left(w_{y}, p_{y}^{2}\right)$ of
biharmonic support $\{y\}$ and the adjoint Green's pair ( $w_{x}^{*}, p_{x}^{1 *}$ ) of support $\{x\}$ (cf., [19], [20]). We denote by $\left(W_{y}^{\omega}, P_{y}^{2, \omega}\right)$ the swept pair on $\omega$ of the former pair, and by $\left(W_{x}^{*, \omega}, P_{x}^{1 *, \omega}\right)$ the swept pair on $\omega$ of the latter pair. We also consider the adjoint pure potential pair $p_{v}^{*}=\left(w_{v}^{*}, p_{v}^{1 *}\right)$ with associated nonnegative measure $v$, where

$$
\begin{aligned}
-\quad w_{v}^{*}(u) & =\int w_{x}^{*}(u) d v(x) \\
-\quad p_{v}^{1 *}(u) & =\int p_{x}^{1^{*}}(u) d v(x)
\end{aligned}
$$

and $\left(W_{v}^{*, \omega}, P_{v}^{1 *, \omega}\right)$ the swept pair corresponding to the open set $\omega$.

Lemma 2. We assert that
$W_{v}^{*, \omega}(y)=\int W_{x}^{*, \omega}(y) d v(x)=\int W_{y}^{\omega}(x) d v(x)$.
Proof. If $\left(\alpha_{y}^{\omega}, \beta_{y}^{\omega}\right)$ is the adjoint swept pair of $\left(\epsilon_{y}, 0\right)$ on $\omega$, then it holds:

$$
\begin{aligned}
W_{v}^{*, \omega}(y)= & \int w_{v}^{*}(u) d \alpha_{y}^{\omega}(u) \\
& +\int p_{v}^{1 *}(u) d \beta_{y}^{\omega}(u) \\
= & \int\left(\int w_{x}^{*}(u) d v(x)\right) d \alpha_{y}^{\omega}(u) \\
& +\int\left(\int p_{x}^{1 *}(u) d v(x)\right) d \beta_{y}^{\omega}(u) \\
= & \int\left(\int w_{x}^{*}(u) d \alpha_{y}^{\omega}(u)\right) d v(x) \\
& +\int\left(\int p_{x}^{1 *}(u) d \beta_{y}^{\omega}(u)\right) d v(x) .
\end{aligned}
$$

On the other hand, since we have $W_{x}^{*, \omega}(y)=$ $\int w_{x}^{*}(u) d \alpha_{y}^{\omega}(u)+\int p_{x}^{1^{*}}(u) d \beta_{y}^{\omega}(u)$, using, [20], Lemma 4, and a remark after the proof of [20], Proposition 4.2, we obtain $W_{y}^{\omega}(x)=W_{x}^{*, \omega}(y)$, which completes the proof.

Theorem 3. Let $(\lambda, 0)$ be a pair of measures supported by the compact set $K$. Then, the following properties are equivalent:
(i) $(\lambda, 0)$ is pure binormal relative to $K$.
(ii) The adjoint pure potential pair $\left(w_{\lambda}^{*}, p_{\lambda}^{1 *}\right)$ vanishes on $C K$.

Proof. First, we notice that as the pair $\left(w_{\lambda}^{*}, p_{\lambda}^{1 *}\right)$ is adjoint biharmonic on $C K$, and therefore compatible, if $w_{\lambda_{1}}^{*}=w_{\lambda_{2}}^{*}$ holds on $C K$, then $p_{\lambda_{1}}^{1 *}=p_{\lambda_{2}}^{1 *}$ also holds on $C K$. In other words, if $(\lambda, 0)$ is pure binormal, then $\lambda$ is 1 -normal.
(ii) $\Rightarrow(i)$. The equality $w_{\lambda_{1}}^{*}=w_{\lambda_{2}}^{*}$ on $C K$ implies that the respective reduced functions satisfy $W_{\lambda_{1}}^{* C K}=$
$W_{\lambda_{2}}^{* C K}$ in $\Omega$, and it follows from Lemma 2 that $\int W_{y}^{c K}(x) d \lambda_{1}(x)=\int W_{y}^{c K}(x) d \lambda_{2}(x)$. In view of [15], Theorem 7.11, we have

$$
\begin{aligned}
\int W_{y}^{C K}(x) d \lambda_{i}(x)= & \int w_{y}(x) d B_{i, 1}^{C K}(x) \\
& +\int p_{y}^{2}(x) d B_{i, 2}^{C K}(x),
\end{aligned}
$$

where $\quad \Lambda:=(\lambda, 0), \quad B_{i}:=\left(\lambda_{i}, 0\right) \quad$ and $\quad \Lambda^{C K}=$ $\left(\Lambda_{1}^{C K}, \Lambda_{2}^{C K}\right), B_{i}^{C K}=\left(B_{i, 1}^{C K}, B_{i, 2}^{C K}\right)$, are the respective swept pairs on $C K$; therefore $\Lambda_{i}^{C K}=B_{1, i}^{C K}-B_{2, i}^{C K}$, ( $i=1,2$ ). Finally, using [15], Theorem 7.1, (cf. also, [14]), we deduce that $B_{1,1}^{C K}=B_{2,1}^{C K}$, and $\int p_{y}^{2}(x) d B_{1,2}^{C K}(x)=\int p_{y}^{2}(x) d B_{2,2}^{C K}(x)$ or equivalently $P_{B_{1,2}}^{* 2}=P_{B_{2,2}}^{* 2}$ in $\Omega$; it follows that $B_{1,2}^{C K}=B_{2,2}^{C K}$, hence $\Lambda_{1}^{C K}=\Lambda_{2}^{C K}=0$.
$(i) \Rightarrow(i i)$. The previous arguments can be reversed to prove the converse implication.

Remark 4. The case of the pair $(0, \mu)$ with $(0, \mu)^{C K}=(0,0)$ was studied in [14], and it was established that $(0, \mu)^{C K}=(0,0) \Leftrightarrow P_{\mu}^{2 *}=0$ on $C K$.

Corollary 5. We suppose that $\mathcal{H}_{1}=\mathcal{H}_{2}$ (that is, $\mathrm{L}_{1}=\mathrm{L}_{2}$ in the classical case). Let ( $\lambda, 0$ ) be a pure binormal pair for the compact set K . Then, $\lambda$ is 1 and 2-normal, while $(\lambda, \lambda)$ is binormal for K .

Proof. It follows from Theorem 3 that $w_{\lambda_{1}}^{*}=w_{\lambda_{2}}^{*}$; as the pair $\left(w_{\lambda}^{*}, p_{\lambda}^{1 *}\right)$ is adjoint biharmonic on $C K$, and therefore compatible, we have $p_{\lambda}^{1 *}=0$ on $C K$, and by assumption, $p_{\lambda}^{1 *}=p_{\lambda}^{2 *}$. We also know that $(\lambda, \lambda)^{C K}=(\lambda, 0)^{C K}+(0, \lambda)^{C K}$. Consequently, $\lambda$ is 1 - and 2 -normal, while in view of Definition 1, $(\lambda, \lambda)$ is binormal.

## 3 Some Examples

The functions $u$ such that $\Delta^{2} u=0$ on an open set $U$ of $\mathbb{R}^{n}$ satisfy a characteristic mean value property (see, [17]):

$$
u(x)=\alpha_{x} \int u d \mu_{x}^{\omega_{1}}(z)-\beta_{x} \int u d \mu_{x}^{\omega_{2}}(z)
$$

where $\omega_{i}\left(x_{0}, R_{i}\right),(i=1,2)$, are concentric balls with $0<R_{1}<R_{2}, \bar{\omega}_{2} \subset U, \alpha_{x}=\frac{R_{2}^{2}-\rho^{2}}{R_{2}^{2}-R_{1}^{2}}, \beta_{x}=\frac{R_{1}^{2}-\rho^{2}}{R_{2}^{2}-R_{1}^{2}}$, $\rho=\left\|x-x_{0}\right\|, x \in \omega_{1}$ and $\mu_{x}^{\omega_{i}},(i=1,2)$, are the respective harmonic measures.

Let $\left(w_{y}, p_{y}^{2}\right)$ be the Green's pair in $\mathbb{R}^{n}$ (cf., [19]); it is biharmonic on the open set $U=\mathbb{R}^{n} \backslash\{y\}$. If $\bar{\omega}_{2} \subset$ $U$ and $x \in \omega_{1}$, then we have
$w_{y}(x)=\alpha_{x} \int w_{y}(z) d \mu_{x}^{\omega_{1}}(z)-\beta_{x} \int w_{y}(z) d \mu_{x}^{\omega_{2}}(z)$
or equivalently
$w_{x}^{*}(y)=\alpha_{x} \int w_{z}^{*}(y) d \mu_{x}^{\omega_{1}}(z)-\beta_{x} \int w_{z}^{*}(y) d \mu_{x}^{\omega_{2}}(z)$
Example 6. We consider the compact set $K=\bar{\omega}_{2}$; the pair of measures $(\lambda, 0)$ with $\lambda=\lambda_{1}-\lambda_{2}$, where $\lambda_{1}=\epsilon_{x}+\beta_{x} \mu_{x}^{\omega_{2}}, \lambda_{2}=\alpha_{x} \mu_{x}^{\omega_{1}}$ is a pure binormal pair of measures. We can also take the decomposition $\lambda=\lambda_{1}-\lambda_{2}, \quad$ where $\lambda_{1}=\alpha_{x} \epsilon_{x}+$ $\beta_{x} \mu_{x}^{\omega_{2}}, \lambda_{2}=\beta_{x} \epsilon_{x}+\alpha_{x} \mu_{x}^{\omega_{1}}$. Moreover, we observe that the pair $(\lambda, \lambda)$ is a binormal pair for $K$.

Example 7. Let $v$ be a measure with compact support in $\omega_{1}$. If $y \in \mathrm{C} \bar{\omega}_{2}$, we obtain:

$$
\begin{aligned}
\int w_{v}^{*}(y)= & \int w_{z}^{*}(y) \int \alpha_{x} d \mu_{x}^{\omega_{1}} d v(x) \\
& -\int w_{z}^{*}(y) \int \beta_{x} d \mu_{x}^{\omega_{2}}(z) d v(x) \\
= & \int w_{z}^{*}(y) d \sigma(z)-\int w_{z}^{*} d \tau(z) .
\end{aligned}
$$

The pair $(\lambda, 0)$, where $\lambda=v+\tau-\sigma$ is pure biharmonic, while the pair $(\lambda, \lambda)$ is a binormal pair.

Note. Obviously, since every compact set is contained in a ball, we can construct pure binormal (respectively binormal) pairs from a given measure.

Example 8. Starting from a measure $\lambda$ supported by a compact set $E \subset \mathbb{R}^{n}$, G. Choquet and J. Deny (cf., [6]) have constructed another measure $\lambda^{\prime}$ such that $d \lambda^{\prime}=U^{\lambda} d \tau$ on $\hat{E}=E \cup\left(\cup_{i} E_{i}\right)$, where the sets $E_{i}$ are the connected components of $C E, \bar{E}_{i}$ is compact, $U^{\lambda}$ is the potential generated by $\lambda$, and $d \tau$ is the volume element (and so on for the polyharmonic case). The potential $U^{\lambda^{\prime}}$ is defined as follows:

$$
\begin{aligned}
U^{\lambda^{\prime}}(x) & =\int G_{1}(x, y) d \lambda^{\prime}(y) \\
& =\int G_{1}(x, y) U^{\lambda}(y) d \tau(y) \\
& =\iint G_{1}(x, y) G_{1}(y, z) d \tau(y) d \lambda(z) \\
& =\int G_{2}(x, z) d \lambda(z),
\end{aligned}
$$

where $G_{1}$ is the Newtonian kernel, and $G_{2}(x, y)=$ $\int G_{1}(x, z) G_{1}(z, y) d \tau(z)$ is the iterated kernel (see, [12]). If $U^{\lambda^{\prime}}(x)=\int G_{2}(x, z) d \lambda(z)=0$, on $C E$, then

$$
\Delta_{x} \int G_{2}(x, z) d \lambda(z)=\int G_{1}(x, z) d \lambda(z)=0 \text { on } C E .
$$

Therefore, the pair $(\lambda, \lambda)$ is binormal.

Example 9. Let $\left(u_{2}^{*}, 1\right)$ be a strictly positive adjoint biharmonic pair and let $V_{2}^{*}$ be the associated kernel of the potential part of $u_{2}^{*}$. If $v_{1}^{*}$ is a nonnegative adjoint 1-hyperharmonic function, the adjoint pair ( $V_{2}^{*} v_{1}^{*}, v_{1}^{*}$ ) is a pure hyperharmonic pair; it will be an adjoint pure potential pair, if $v_{1}^{*}$ is an adjoint 1potential, continuous with a compact harmonic* support. Let $\lambda$ be a measure supported by a compact set $K \subset \Omega$; we have $p_{\lambda}^{1 *}(x)=\int p_{z}^{1 *}(x) d \lambda(z)$, as well as $V_{2}^{*} 1(y)=\int p_{x}^{2 *}(y) d \xi(x)$, where $\xi$ is the nonnegative measure associated with the adjoint potential $V_{2}^{*} 1$. Now, let $\lambda^{\prime}$ be another measure with density $p_{\lambda}^{1^{*}}$ relative to $\xi$; we consider the following function:

$$
\begin{aligned}
q_{2}^{*}(y) & =\int p_{x}^{2 *}(y) p_{\lambda}^{1 *}(x) d \xi(x) \\
& =\int\left(\int p_{z}^{1 *}(x) p_{x}^{2 *}(y) d \xi(x)\right) d \lambda(z) \\
& =\int w_{z}^{*}(y) d \lambda(z)=V_{2}^{*} p_{\lambda}^{1 *}(y) \\
& =w_{\lambda}^{*}(y) .
\end{aligned}
$$

Therefore, if $V_{2}^{*} p_{\lambda}^{1 *}=0$ on $C K$, we also have that $p_{\lambda}^{1 *}=0$. Consequently, the pair $(\lambda, 0)$ is pure binormal for $K$. On the other hand, if $\mu$ is a 2 normal measure for $K$, then the pair $(\lambda, \mu)$ will be binormal for $K$.

## 4 Some Mean Values Properties of Biharmonic Pairs

Let us recall some further results on harmonic and biharmonic spaces (cf., [15], parts X, XI). In a harmonic space, we consider a potential $P$ on $\Omega$, which is finite, continuous, and strictly superharmonic. Let $\xi$ be its associated nonnegative measure. We define Dynkin's operators $L$, and $L^{\prime}$ relative to $P$, as

$$
\begin{align*}
L_{P} f(x) & =\limsup _{\omega \searrow x} \frac{f(x)-\int f d \rho_{x}^{\omega}}{P(x)-\int P d \rho_{x}^{\omega}}  \tag{1}\\
L_{P}^{\prime} f(x) & =\liminf _{\omega \searrow x} \frac{f(x)-\int f d \rho_{x}^{\omega}}{P(x)-\int P d \rho_{x}^{\omega}} \tag{2}
\end{align*}
$$

where $x \in \Omega, \omega$ is an open set with $\bar{\omega}$ compact, $f$ is a numerical function on $\Omega$ such that the numerator in (1) and (2) is defined, and $\rho_{x}^{\omega}$ is the harmonic measure. We can see that $L_{P} f(x)=L_{p^{\omega}} f(x)$ on the harmonic space $\omega$, where $p^{\omega}=P(x)-\int P d \rho_{x}^{\omega}$, and $x \in \omega$. Moreover, if $V$ is the kernel associated with $P$, then we have $L V \phi=L^{\prime} V \phi=\phi$, for $\phi \in$ $C_{b}(\Omega)$. The following inequality $L u(x) \geq 0$
( or $L^{\prime} u(x) \geq 0$ ) on an open set $U \subset \Omega$ is also characteristic of hyperharmonic functions on $U$.

Let $L^{j}, L^{j^{\prime}}$ be the operators in (1)-(2) associated to the space $\left(\Omega, \mathcal{H}_{j}\right)(j=1,2)$. We say that the pair ( $f_{1}, f_{2}$ ) of finite and continuous functions in the open set $U \subset \Omega$, is regular if $L^{1} f_{1}$ and $L^{2} f_{2}$ (or equivalently $L^{1^{\prime}} f_{1}$ and $L^{2^{\prime}} f_{2}$ ) are finite and continuous in $U$.

Next, we define the operators:

$$
\begin{aligned}
& \Gamma_{1} f(x)=\limsup _{\omega \searrow x} \frac{f(x)-\int f d \mu_{x}^{\omega}}{\int d v_{x}^{\omega}}, \\
& \Gamma^{\prime}{ }_{1} f(x)=\liminf _{\omega \searrow x} \frac{f(x)-\int f d \mu_{x}^{\omega}}{\int d v_{x}^{\omega}} .
\end{aligned}
$$

Since on a relatively compact open set, there exists a strictly positive biharmonic pair $\left(v_{1}, v_{2}\right)$, we can assume, without loss of generality, that $v_{2}=1$. The Riesz decomposition yields $v_{1}=p_{1}+h_{1}$, where $p_{1}$ is a 1 -potential and $h_{1}$ is a 1 -harmonic function on $\omega$. We have $L_{p_{1}} f(x)=\Gamma_{1} f(x)$, and $L_{p_{1}}^{\prime} f(x)=$ $\Gamma_{1}^{\prime} f(x)$. Moreover, the inequality $\Gamma_{1} w_{1} \geq w_{2}$ (or $\Gamma_{1}^{\prime} w_{1} \geq w_{2}$ ), at the points where $w_{1}$ is finite, is a characteristic property of the hyperharmonic pairs $\left(w_{1}, w_{2}\right)$.

Proposition 10. $(\lambda, \mu)$ be a binormal pair of measures supported by a compact set $K \subset U$, where $U$ is an open subset of $\Omega$, and ( $u_{1}, u_{2}$ ) a biharmonic pair of functions on $U$. Then, $\int u_{1} d \lambda=0$, and $\int u_{2} d \mu=0$.

Proof. We know that $\int u_{2} d \mu=0$ if $\mu$ is a 2 -normal measure relative to a compact set $K \subset U$ (cf., [14], Proposition 1]). Thus, it remains to prove the other equality. Let us consider a relatively compact open set $\omega$, such that $K \subset \omega \subset \bar{\omega} \subset U$. By [18], Proposition 1.7, there exist continuous potential pairs $\left(p_{1}, p_{2}\right)$, and $\left(q_{1}, q_{2}\right)$, which are biharmonic on $\omega$, and such that $\left(u_{1}, u_{2}\right)+\left(q_{1}, q_{2}\right)=\left(p_{1}, p_{2}\right)$. We have the decompositions: $\left(p_{1}, p_{2}\right)=\left(p_{1}{ }_{1}, p_{2}\right)+$ $\left(s_{1}, 0\right)$, as well as $\left(q_{1}, q_{2}\right)=\left(q^{\prime}{ }_{1}, q_{2}\right)+\left(t_{1}, 0\right)$, where $\left(p_{1}^{\prime}, p_{2}\right),\left(q_{1}^{\prime}, q_{2}\right)$ are pure potential pairs in $\Omega$, biharmonic on $\omega$, while $s_{1}$ and $t_{1}$ are 1-potentials in $\Omega$ (see, [18], Proposition 2.8 and Proposition 2.2); moreover, $s_{1}$ and $t_{1}$ are 1-harmonic on $\omega$, since $\Gamma_{1} p_{1}=\Gamma_{1} p^{\prime}{ }_{1}=p_{2}, \Gamma_{1} q_{1}=\Gamma_{1} q^{\prime}{ }_{1}=q_{2}$ on $\Omega$, while $\Gamma_{1}\left(p_{1}-p^{\prime}{ }_{1}\right)=0, \Gamma_{1}\left(q_{1}-q^{\prime}{ }_{1}\right)=0$ on $\omega$, (cf., [15], Corollary 11.4). Therefore, we have on $\omega$ : $u_{1}=$ $p_{1}-q_{1}=p_{1}^{\prime}-q_{1}^{\prime}+h_{1}$, where $h_{1}=s_{1}-t_{1}$ is $1-$
harmonic on $\omega$. Finally, the nonnegative measures $\zeta$ and $\xi$ associated with the pure pairs $\left(p^{\prime}{ }_{1}, p_{2}\right)$ and $\left(q_{1}^{\prime}, q_{2}\right)$ (cf., [18], (3.13)), are supported by $\mathrm{C} \omega$. As $\int h_{1} d \lambda=0$, (cf., [14], Proposition 1), we obtain:

$$
\begin{aligned}
\int u_{1} d \lambda & =\int h_{1} d \lambda+\int\left(p_{1}{ }_{1}-q^{\prime}{ }_{1}\right) d \lambda \\
& =\iint w_{y}(x) d \theta(y) d \lambda(x) \\
& =\int\left(\int w_{y}(x) d \lambda(x)\right) d \theta(y)=0,
\end{aligned}
$$

where $\theta=\zeta-\xi$, since $\int w_{y}(x) d \lambda(x)=0$ holds on $C K \supset C \omega$.

Next, we shall study the converse of Proposition 10.
Proposition 11. Let $U$ be an open subset of $\Omega$ and let $\left(u_{1}, u_{2}\right)$ be a pair of regular functions satisfying $\int u_{1} d \lambda_{i}=0, \int u_{2} d \mu_{i}=0$ for a family $\left(\lambda_{i}, \mu_{i}\right)$ of binormal pairs of measures relative to compact sets $K_{i} \subset \omega_{i}$ with $\lambda_{i} \neq 0, \mu_{i} \neq 0$, such that $P_{\lambda_{i, 1}}^{1 *} \geq P_{\lambda_{i, 2}}^{1 *}$, $P_{\mu_{i, 1}}^{2 *} \geq P_{\mu_{i, 2}}^{2 *}$, for all $i \in I$, the open sets $\omega_{i}$ forming a basis of $U$; then, the pair $\left(u_{1}, u_{2}\right)$ is biharmonic on $U$.

Proof. Let $\omega$ be an open set with $\bar{\omega} \subset U$ and $\bar{\omega}$ compact. There is a strictly positive biharmonic pair ( $v_{1}, v_{2}$ ) on $\omega$ (cf., [15], Theorem 6.9); without loss of generality, we may assume that $v_{2}=1$, and we may replace $U$ with $\omega$. In the associated 1-harmonic space, the Riesz decomposition implies that $v_{1}=$ $p_{1}+h_{1}$; we consider the kernel $V_{1}^{\omega}$ associated with the potential $p_{1}$ and the associated operators $L_{1}, \Gamma_{1}$ (cf., [15], parts X, XI). The pair $\left(V_{1}^{\omega} u_{2}, u_{2}\right)$ is biharmonic since $L_{1} V_{1}^{\omega} u_{2}=\Gamma_{1} V_{1}^{\omega} u_{2}=u_{2}$, and $u_{2}$ is a 2 -harmonic function (cf., [14], Proposition 2) ${ }^{1}$. It follows from Proposition 10 that $\int V_{1}^{\omega} u_{2} d \lambda_{i}=0$ holds for all $\lambda_{i}$ satisfying the assumptions of Proposition 11. At this stage, we consider the function $\phi=V_{1}^{\omega} u_{2}-u_{1}$ on $\omega$; since the functions $V_{1}^{\omega} u_{2}$ and $u_{1}$ are continuous on $\omega, \phi$ will also be continuous on $\omega$. Therefore, we obtain $\int \phi d \lambda_{i}=0$. In addition, since $p_{\lambda_{i}}^{1 *}=0$ on $C K_{i}$ (see the beginning of the proof of Theorem 3), $\phi$ is in view of [14], Proposition 3, a 1-harmonic function, that we denote by $r_{1}$. Therefore, $u_{1}=V_{1}^{\omega} u_{2}-r_{1}$ is the first

[^0]component of a biharmonic pair on $\omega$, namely, of the pair $\left(V_{1}^{\omega} u_{2}-r_{1}, u_{2}\right)$. Finally, since the pair ( $u_{1}, u_{2}$ ) is biharmonic on every open set $\omega \subset \bar{\omega} \subset$ $U$, with $\bar{\omega}$ compact, it will also be biharmonic on $U$.

Corollary 12. Let $L_{j}(j=1,2)$ be a second-order linear elliptic operator with regular coefficients defined on a domain $\Omega \subset \mathbb{R}^{n}(n \geq 2)$. We consider the biharmonic space of the solutions of the system $L_{1} u_{1}=-u_{2}, L_{2} u_{2}=0$ on $\Omega$. We suppose that there exists a positive potential pair; therefore, there exists a positive $L_{j}$-potential $(j=1,2)$ (cf., [15], part XI, [9], Chap. VII). Then, $u_{1}(x)=$ $\alpha_{x} \int u_{1} d \mu_{x}^{\omega_{1}}-\beta_{x} \int u_{1} d \mu_{x}^{\omega_{2}}$ holds for every $x \in \Omega$, where $\omega_{1}, \omega_{2}$ are concentric balls such that $x \in$ $\omega_{1} \subset \overline{\omega_{2}} \subset \Omega$ (cf. Section 3). This property is characteristic of biharmonic ${ }^{2}$ functions on $\Omega$. We notice that if $L_{1}=L_{2}$, then we can also write $u_{2}(x)=\alpha_{x} \int u_{2} d \mu_{x}^{\omega_{1}}-\beta_{x} \int u_{2} d \mu_{x}^{\omega_{2}}$.

## 5 Properties of Binormal Pairs of Measures

Let $\lambda, \mu$ be measures, $\lambda=\lambda_{1}-\lambda_{2}, \mu=\mu_{1}-\mu_{2}$, with $\lambda_{i} \geq 0, \mu_{i} \geq 0, \quad(i=1,2)$, and consider the pairs $\Lambda:=(\lambda, 0), B_{i}:=\left(\lambda_{i}, 0\right)$, as well as the pair $M:=(0, \mu)$. Therefore, we have $\Lambda_{i}^{C K}=B_{1, i}^{C K}-B_{2, i}^{C K}$ and $M^{C K}=(0, \mu)^{C K}$ (cf. Section 1 and the proof of Theorem 3).

Theorem 13. The following are equivalent:
(i) The pair $\Lambda=(\lambda, 0)$ is pure binormal and the pair $M=(0, \mu)$ is 2 -normal.
(ii) $\quad \Lambda_{i}^{C K}=0$, and $M_{i}^{C K}=0(i=1,2)$.
(iii) $\int\left(p_{1}-q_{1}\right) d \lambda=0$ and $\int\left(p_{2}-q_{2}\right) d \mu=$ 0 , where $\left(p_{1}, p_{2}\right),\left(q_{1}, q_{2}\right)$ are potential pairs in $\Omega$ with support in $C K$.
(iv) The previous potential pairs could be pure potential pairs.
(v) $\quad \int u_{1} d \lambda=0$, and $\int u_{2} d \mu=0$ hold for every biharmonic pair of functions ( $u_{1}, u_{2}$ ) on an open set $\omega \supset K$.

[^1](vi) $\lambda=\xi-\Xi_{1}^{C K}$, and $\Xi_{2}^{C K}=0$, where $(\xi, 0)^{C K}=\left(\Xi_{1}^{C K}, \Xi_{2}^{C K}\right)$ with $\xi$ the part of $\lambda$ supported by the set of points of $K$ where $C K$ is 1 -thin; $\mu=\tau-T_{2}^{C K}$, where $(0, \tau)^{C K}=\left(T_{1}^{C K}, T_{2}^{C K}\right)$, with $\tau$ the part of $\mu$ supported by the set of points where C $K$ is 2-thin.

Proof. (i) $\Leftrightarrow$ (ii). We have already established the first part of Theorem 13 in the proof of Theorem 3. Concerning the second part, we can see that these implications are well-known in harmonic spaces (cf., [14]).
$(i) \Rightarrow(v)$. This is proved in Proposition 10.
(v) $\Rightarrow$ (i). Suppose there exist points $y_{1}, y_{2} \in C K$ where $w_{\lambda_{1}}^{*}\left(y_{1}\right) \neq w_{\lambda_{2}}^{*}\left(y_{1}\right), p_{\mu_{1}}^{2 *}\left(y_{2}\right) \neq p_{\mu_{2}}^{2 *}\left(y_{2}\right)$; we take as $\left(u_{1}, u_{2}\right)$ the Green pair $\left(w_{y}, p_{y}^{2}\right)$ and we have $\int w_{y_{1}}(x) d \lambda_{1}(x)=\int w_{y_{1}}(x) d \lambda_{2}(x)$ as well as $\int p_{y_{2}}^{2}(x) d \mu_{1}(x)=\int p_{y_{2}}^{2}(x) d \mu_{2}(x)$, therefore we get $w_{\lambda_{1}}^{*}\left(y_{1}\right)=w_{\lambda_{2}}^{*}\left(y_{1}\right)$ and $p_{\mu_{1}}^{2 *}\left(y_{2}\right)=p_{\mu_{2}}^{2 *}\left(y_{2}\right)$, which contradicts our assumptions (cf. Theorem 3).
(iii) $\Rightarrow$ (v). By [18], Proposition 1.7, there are two continuous potential pairs $\left(p_{1}, p_{2}\right)$, and $\left(q_{1}, q_{2}\right)$, which are biharmonic on a relatively compact open set $\omega^{\prime}$, with $K \subset \omega^{\prime} \subset \overline{\omega^{\prime}} \subset \omega$, and such that $u_{i}=$ $p_{i}-q_{i}$ on $\omega^{\prime},(\mathrm{i}=1,2)$.
(v) $\Rightarrow$ (iii). We choose an open set $U \supset K$ such that the supports of the potential pairs $\left(p_{1}, p_{2}\right)$, and ( $q_{1}, q_{2}$ ) are not contained in $U$; hence, these pairs are biharmonic on $U$.
(iii) $\Rightarrow$ (iv). This is straightforward because (iv) is a particular case of (iii).
(iv) $\Rightarrow$ (i). Suppose there exist two points $y_{1}, y_{2} \in$ CK such that $w_{\lambda_{1}}^{*}\left(y_{1}\right) \neq w_{\lambda_{2}}^{*}\left(y_{1}\right)$, and $p_{\mu_{1}}^{2 *}\left(y_{2}\right) \neq$ $p_{\mu_{2}}^{2 *}\left(y_{2}\right)$. We take as pure potential pairs supported on $\mathrm{C} K$, the Green's pairs $\left(w_{y}, p_{y}^{2}\right)$, and $\left(k w_{y}, k p_{y}^{2}\right)$, where $k>0, \quad k \neq 1$. Therefore, we obtain

$$
\begin{aligned}
& \int\left(k w_{y_{1}}(x)-w_{y_{1}}(x)\right) d \lambda_{1}(x)= \\
& \int\left(k w_{y_{1}}(x)-w_{y_{1}}(x)\right) d \lambda_{2}(x)
\end{aligned}
$$

and $(k-1) p_{\mu_{1}}^{2 *}\left(y_{2}\right)=(k-1) p_{\mu_{2}}^{2 *}\left(y_{2}\right)$; clearly, this contradicts our assumptions (see also Theorem 3).
(ii) $\Rightarrow(\mathrm{vi}) .(\lambda, 0)=(\xi, 0)+(\sigma, 0)$, with $\sigma$ the part of $\lambda$ supported by the set of points where $\mathrm{C} K$ is not 1 thin. Setting $\Sigma:=(\sigma, 0)$, we have $(\lambda, 0)^{C K}=$ $\left(\Lambda_{1}^{C K}, \Lambda_{2}^{C K}\right)=\left(\Xi_{1}^{C K}, \Xi_{2}^{C K}\right)+\left(\Sigma_{1}^{C K}, \Sigma_{2}^{C K}\right)$. On the
other hand, we know that $\Sigma_{1}^{C K}=\sigma$. As $\Lambda_{1}^{C K}=0$, we deduce that $\Sigma_{1}^{C K}+\Xi_{1}^{C K}=0$; consequently, it follows that $\lambda=\xi+\sigma=\xi-\Xi_{1}^{C K}$. Furthermore, since $\Lambda_{2}^{C K}=0$, we obtain $\Xi_{2}^{C K}+\Sigma_{2}^{C K}=0$. Finally, in view of [16], Remark 2.12, we conclude that $\Sigma_{2}^{C K}=0$ (see also, [15], Theorem 7.13).
(vi) $\Rightarrow$ (i). We know that $\int P_{1}^{C K} d \xi=\int p_{1} d \Xi_{1}^{C K}+$ $\int p_{2} d \Xi_{2}^{C K}$, where $\left(p_{1}, p_{2}\right)$ is a potential pair; since $\Xi_{2}^{C K}=0$, it follows that $\int P_{1}^{C K} d \xi=\int p_{1} d \Xi_{1}^{C K}$. Now, if $\left(p_{1}, p_{2}\right)$ is the Green's pair $\left(w_{y}, p_{y}^{2}\right)$, then we have $\int W_{y}^{C K}(x) d \xi(x)=\int w_{y}(z) d \Xi_{1}^{C K}(z)$. That is, $\int W_{x}^{*}{ }^{〔 K}(y) d \xi(x)=\int w_{z}^{*}(y) d \Xi_{1}^{C K}(z)$, in view of Lemma 1. As for $x \in K$, it holds that $W_{x}^{*}{ }^{*} K=w_{x}^{*}$ on $C K$, so we deduce that $\int w_{x}^{*}(y) d \xi(x)=$ $\int w_{z}^{*}(y) d \Xi_{1}^{C K}(z) ;$ therefore, $w_{\lambda}^{*}=0$ on $\mathrm{C} K$.

Note. We point out that the implication (vi) $\Rightarrow$ (ii) can be established, by reversing the arguments in the proof of (ii) $\Rightarrow$ (vi). We can see in the proof of [4], Proposition 3, that $\sigma=-\Xi_{1}^{C K}$ holds for every 1normal measure.

Theorem 14. Let $K$ be a compact subset of $\Omega$. The following are equivalent:
(i) There exists a pure binormal pair of measures $(\lambda, 0)$ for the compact set $K$, with $\lambda \neq 0$.
(ii) $\quad \mathrm{C} K$ is 1-thin for at least one point of $K$.

Proof. (i) $\Rightarrow$ (ii). In view of Theorem 13, we have $\Lambda_{i}^{\subset K}=0,(i=1,2)$, and by assumption $\lambda \neq 0$. If $C K$ is not 1 -thin at any point of $K$, then we will obtain $\lambda=\Lambda_{1}^{C K} \quad$ (cf., [14], Proposition 3); since $\Lambda_{1}^{\mathrm{CK}}=B_{1,1}^{\mathrm{CK}}-B_{2,1}^{\mathrm{CK}}=0$, it follows that $\lambda=0$. This is a contradiction.
(ii) $\Rightarrow(\mathrm{i})$. Given a pure binormal pair $(\lambda, 0)$, suppose that $\lambda=0$. By assumption and in view of Theorem 13, we will obtain $\lambda-\Lambda_{1}^{C K}=\xi-\Xi_{1}^{C K}=0$ and $\xi \neq$ 0 (since $C K$ is 1 -thin for at least one point of $K$ ). As the measure $\xi$ is supported by the set of unstable points of $K$, and $\Xi_{1}^{C K}$ is supported by the set of points where $C K$ is not 1 -thin, we deduce that $\xi \neq$ $\Xi_{1}^{C K}$ (see, [1], Proposition 4.6, [4], Lemma VIII, 2); therefore, $\lambda \neq 0$, which is a contradiction.

We denote by $\mathcal{M}$ the set of measures on $\Omega$. We endow it with the vague topology, that is, the topology of the simple convergence on the space of
continuous functions with compact support. Similarly, we consider the set $\mathcal{M} \times \mathcal{M}$ with the respective vague topology. We also denote by $\mathcal{K}_{i}$ the set of points of $K$, where $C K$ is $i$-thin, and by $\mathcal{N}$ (resp. $\mathcal{N}_{i}$ ), the set of pure binormal pairs of measures (resp. the set of $i$-normal measures, $i=$ $1,2)$ for $K$. Finally, we recall that $\left(\epsilon_{x}, 0\right)^{C K}=$ $\left(\mu_{x}^{C K}, v_{x}^{C K}\right)$, where $\mu_{x}^{C K}$ is the swept measure of $\epsilon_{x}$ on $C K$ in the 1 -harmonic space, and $\left(0, \epsilon_{x}\right)^{C K}=$ $\left(0, \lambda_{x}^{C K}\right)$, where $\lambda_{x}^{C K}$ is the swept measure of $\epsilon_{x}$ on $C K$ in the 2-harmonic space.

## Theorem 15.

(i) The pairs $\left(\epsilon_{x}-\mu_{x}^{C K}, v_{x}^{C K}\right)$, where $x \in$ $\mathcal{K}_{1}$, form a total subset of $\mathcal{N}$.
(ii) The measures $\left(\epsilon_{x}-\mu_{x}^{C K}\right)$, where $x \in \mathcal{K}_{1}$, form a total subset of $\mathcal{N}_{1}$.
(iii) The measures $\left(\epsilon_{x}-\lambda_{x}^{C K}\right)$, where $x \in \mathcal{K}_{2}$, form a total subset of $\mathcal{N}_{2}$.

Proof. (i) First, it is well known that the swept pair $\left(E_{1}^{C K}, E_{2}^{C K}\right)$ of $(\xi, 0)$ on $C K$, is expressed by $\Xi_{1}^{C K}(f)=\int \mu_{x}^{C K}(f) d \xi(x), \Xi_{2}^{C K}(f)=\int v_{x}^{C K}(f) d \xi(x)$, where $f$ is any continuous function with compact support. Next, we recall that by definition of the integral, there exist points $x_{n}$ of $\mathcal{K}_{1}$ such that
$\left|\int \mu_{x}^{C K}(f) d \xi(x)-\sum_{n=1}^{N} \lambda_{n} \mu_{x_{n}}^{C K}(f)\right|<\epsilon^{\prime}$
with $\sum_{n=1}^{N} \lambda_{n}=\xi\left(\mathcal{K}_{1}\right)$. Note that by considering a suitable partition of $\mathcal{K}_{1}$, we can choose the (same) coefficients $\lambda_{j}$, such that relations (3) and (4) are satisfied (cf. [5, p. 109-109], [2] and [7, p. 126-127].

Moreover, according to [2], Theorem 1, chap. III, §2, No. 4, there exists a linear combination $\sum_{j=1}^{p} \lambda_{j} \epsilon_{x_{j}}$ such that

$$
\begin{equation*}
\text { | } \sum_{j=1}^{p} \lambda_{j} \epsilon_{x_{j}}(f)-\xi(f) \mid<\epsilon^{\prime \prime} \text { and } \sum_{j=1}^{p} \lambda_{j}=\xi\left(\mathcal{K}_{1}\right) . \tag{4}
\end{equation*}
$$

Consequently, by combining (3) and (4), we can write

$$
\begin{gathered}
\sum_{i=1}^{q} \lambda_{i}\left(\epsilon_{x_{i}}-\mu_{x_{i}}^{C K}\right)(f)-\epsilon \leq \xi(f)-\Xi_{1}^{C K}(f) \\
\leq \sum_{i=1}^{q} \lambda_{i}\left(\epsilon_{x_{i}}-\mu_{x_{i}}^{C K}\right)(f)+\epsilon
\end{gathered}
$$

and $-\epsilon \leq \sum_{i=1}^{q} \lambda_{i} v_{x_{i}}^{C K}(f) \leq \epsilon$ with $\sum_{i=1}^{q} l_{i}=\xi\left(\mathcal{K}_{1}\right)$. Since, by Theorem 13, $(\lambda, 0)=(\xi, 0)-\left(\Xi_{1}^{C K}, \Xi_{2}^{C K}\right)$, the result follows. Assertions (ii) and (iii) can be proved in the same way.

Finally, we shall examine how normal and binormal measures are connected.

## Proposition 16.

(i) If $(\lambda, 0)$ is a pure binormal pair for the compact set $K$, then the measure $\lambda$ is 1 normal for $K$.
(ii) Conversely, suppose that $\lambda$ is a 1-normal measure for $K$. Then the pair $(\lambda, 0)$ is not necessarily a pure binormal pair, even if the $j$-harmonic spaces coincide ( $j=1,2$ ).

Proof. (i) Since the pair $\left(w_{\lambda}^{*}, p_{\lambda}^{1 *}\right)$ is biharmonic adjoint on $C K$, and therefore compatible, then the equality $w_{\lambda_{1}}^{*}=w_{\lambda_{2}}^{*}$ on $C K$ implies that $p_{\lambda_{1}}^{1 *}=p_{\lambda_{2}}^{1 *}$ holds there. Consequently, $\lambda$ is 1 -normal for $K$. (ii) If $p_{\lambda_{1}}^{1 *}=p_{\lambda_{2}}^{1 *}$ on $C K$, then we assert that $w_{\lambda_{1}}^{*}=$ $w_{\lambda_{2}}^{*}+h_{2}^{*}$ on CK, where $h_{2}^{*}$ is an adjoint 2-harmonic function on CK. Indeed, since the pure potential pairs satisfy the relations $\Gamma_{1}^{*} w_{\lambda_{1}}^{*}=p_{\lambda_{1}}^{1 *}$ and $\Gamma_{1}^{*} w_{\lambda_{2}}^{*}=$ $p_{\lambda_{2}}^{1 *}$ on $C K$, we obtain $\Gamma_{1}^{*}\left(w_{\lambda_{1}}^{*}-w_{\lambda_{2}}^{*}\right)=0$ on $C K$, that is, $w_{\lambda_{1}}^{*}-w_{\lambda_{2}}^{*}=h_{2}^{*}$, where $h_{2}^{*}$ is an adjoint 2harmonic function on the complement of $K$.

Let us now take for the elliptic operator, the Laplacian. We have the following inclusion:
$\{\lambda:(\lambda, 0)$ is pure binormal $\}$

$$
\subset\{\lambda: \lambda \text { is a } 1-\text { normal measure }\} .
$$

For instance, the measure $\lambda=\epsilon_{x}-\mu_{x}^{\omega}$, where $\omega$ is a ball, is normal for $K=\bar{\omega}$, but the pair $(\lambda, 0)$ is not a pure binormal pair. On the other hand, the measure $\lambda=\epsilon_{x}-\alpha_{x} \mu_{x}^{\omega_{1}}+\beta_{x} \mu^{\omega_{2}}$ is 1-normal, and the pair $(\lambda, 0)$ is also pure binormal $\left(\omega_{1}, \omega_{2}\right.$ are concentric balls, and $\omega_{1} \subset \bar{\omega}_{1} \subset \omega_{2}$ ).

Nevertheless, in general, we have:

Proposition 17. Let $\lambda$ be a 1 -normal measure for $K$. Then, $(\lambda, 0)$ is a pure binormal pair if and only if $E_{2}^{C K}=0$.

Proof. This follows immediately from Theorem 13.

## 6 Conclusion and Future Work

In the present paper, we consider a biharmonic elliptic space, corresponding in $\mathbb{R}^{n}$ to the solutions of the system $L_{1} h_{1}=-h_{2}, L_{2} h_{2}=0$, where the second-order linear elliptic differential operators $L_{i}$ ( $i=1,2$ ) (cf., [15]), have adjoint operators $L_{i}^{*}(i=$ 1,2 ) satisfying $L_{2}^{*} h_{2}=-h_{1}, L_{1}^{*} h_{1}=0$ (cf., [20]). By introducing binormal pairs of measures, we have extended the normal measures from the harmonic case (cf., [6], [10], [14]) to the biharmonic context.

More specifically, by using pure adjoint potential pairs, we have studied the binormal pairs of measures satisfying the equivalent properties of Theorem 3. We have also established some characteristic properties of biharmonic pairs and binormal pairs of measures. In addition, we have pointed out in Theorems 13 and 14, the connection between binormal pairs of measures and the fine topologies of the associated harmonic spaces (corresponding in $\mathbb{R}^{n}$ to the solutions of equations $L_{1} h=0$ and $L_{2} u=0$ respectively). On the other hand, Theorem 15 provides an approximation of pure binormal pairs of measures by normal measures.

Finally, Example 6 generalizes a characteristic property of the classical biharmonic case for the equation $\Delta^{2} u=0$ (cf., [17]). It is an important result that may be useful to study some boundary value problems, for the above systems. For instance, it would be interesting to examine the following biharmonic problem in $\mathbb{R}^{n}$. Can we determine a biharmonic function in the interior of a smooth domain if its values and the values of its normal derivative are known on the boundary? Here, a biharmonic function is the first component of a biharmonic pair. Another interesting open problem would be the extension of the results in [13], in the context of the heat equation, to more general parabolic operators.

Contribution of Individual Authors to the Creation of a Scientific Article (Ghostwriting Policy)
The authors equally contributed to the present research, at all stages from the formulation of the problem to the final findings and solution.

Sources of Funding for Research Presented in a Scientific Article or Scientific Article Itself
No funding was received for conducting this study.

## Conflict of Interest

[^0]:    ${ }^{1}$ Analogous notions and results are available in the adjoint case.

[^1]:    ${ }^{2}$ The function $u_{1}$ is called biharmonic on $\Omega$, if it is the first component of a biharmonic pair on $\Omega$.
